Dear Hiring Manager,

I am applying for the Mechanical and Electrical Technician position with Space Dynamics Laboratory. I hold a Bachelor's and Master's degree in Electrical Engineering from Utah State University and have hands-on experience in electrical assembly, wiring harness fabrication, PCB integration, and system-level testing.

In my experience, I have built and tested wiring harnesses for high-voltage EV charging systems, including CAD-based design, crimping, termination, and continuity verification. I have also assembled and soldered PCB systems, executed structured test procedures, and used laboratory instrumentation to validate performance and troubleshoot electrical faults.

Through graduate research and ASPIRE, I have gained experience in hardware integration, test execution, and troubleshooting of complex electrical systems, including repairing undocumented electronics and validating system performance through structured testing and documentation. I also contributed to multidisciplinary engineering projects where I supported system assembly, integration, and verification from build through testing.

I am especially interested in SDL because of its focus on mission-critical space hardware and hands-on integration and test work. I enjoy building and validating physical systems where precision and reliability matter, and I would welcome the opportunity to contribute to SDL's engineering team.

Thank you for your consideration. I look forward to the opportunity to discuss my qualifications further.

Sincerely,
Nathan Walker
